Track Layouts Gauge HO

for M-Tracks 5100/5200

0351

TO ALL MÄRKLIN ENTHUSIASTS:

These track layouts for the MÄRKLIN HO Gauge model railway give a very complete idea of the way our various productions can be used. The plans have been worked out in detail, so that the railway systems can be made up without difficulty — it is our hope, moreover, that they will encourage our many friends to make out their own plans.

So that the plans may be clearer, the cables from points and signals are only briefly indicated, the numbers shown being taken to similar numbers on the control panels.

The Lists of Parts in every case contain everything required for building up the track plans shown.

Planning and building up the overhead contact wire system is made considerably easier by the contact mast 7010 shown on the plans and by the List of Parts giving what is required for the overhead wire system.

The model railway enthusiast who draws inspiration from this booklet of ours for laying out his own system can use our range of MÄRKLIN Parts, e. g., single points, curved points and double-slip points to make for his own railway an exact replica of any kind of station on a full-sized line.

So we trust this Book of Track Layouts may prove to be a good guide and counsellor to all devotees of the MÄRKLIN Model Railway.

GEBR. MÄRKLIN & CIE. GMBH · 732 GÖPPINGEN / GERMANY

The illustrations on pages 1 and 4 of the cover are sections of MÄRKLIN Layouts 18 and 9.

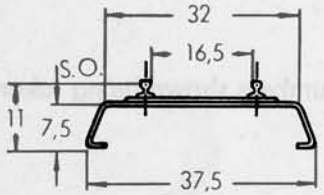
SYMBOLS FOR THE TRACK, POINTS, SIGNALS etc.

MÄRKLIN

All dimensions of track sections and accessories important for constructing a MÄRKLIN model railway system are given in inches (millimetres) in the following diagrams, the drawings being made to a scale of 1 to 5 for clearness.

DIAGRAMS OF TRACK SECTIONS



Catalogue No.	Description
	Dimensions of MÄRKLIN track sections
5106	Straight Track Full length = 7″
5107	Straight Track Half length = 3½″

ADVANTAGES OF THE MÄRKLIN 5140 CURVED POINTS

- Longer sidings with the same size track layout.
- 3″ spacing (77,4 mm) between parallel tracks.
- Points can be built into curved tracks without difficulty.
- Curved points fit harmoniously into any track plan.

1. Longer trains than before can be stationed between the points on layouts of the same size when using MÄRKLIN curved points.
2. With a pair of MÄRKLIN curved points traffic can cross over directly on a curve from the inner to the outer line, or vice-versa, the 3″ (77,4 mm) spacing still being kept between concentric curves.
3. The track length does not need making up when MÄRKLIN curved points are laid, provided the 3″ (77,4 mm) spacing is maintained between concentric curves, consequently track make-up sections are unnecessary.
4. MÄRKLIN curved points are provided with scale-model lanterns to light up.

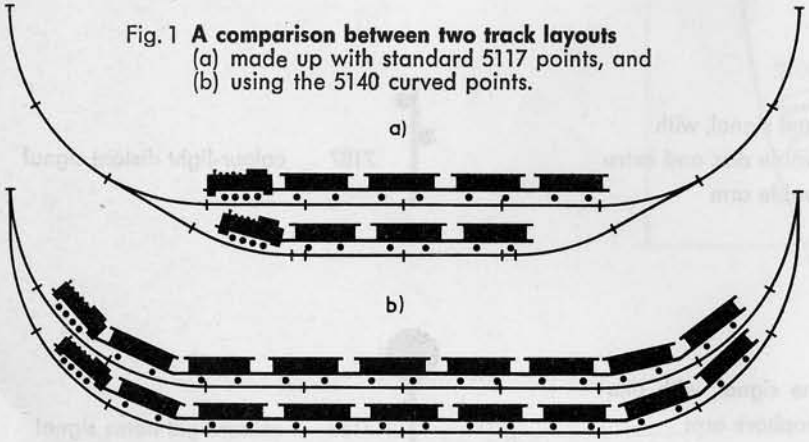

Fig. 1 **A comparison between two track layouts**
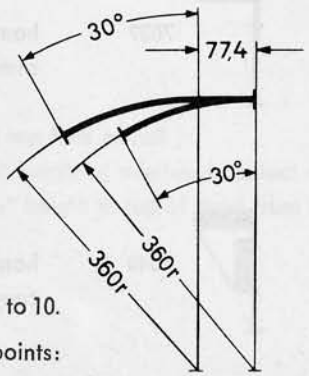
(a) made up with standard 5117 points, and
(b) using the 5140 curved points.

The extra length of siding track gained in case (b) with the same spacing between the lines is considerable.



Scale: 1 to 10.

The most important dimensions of curved points:

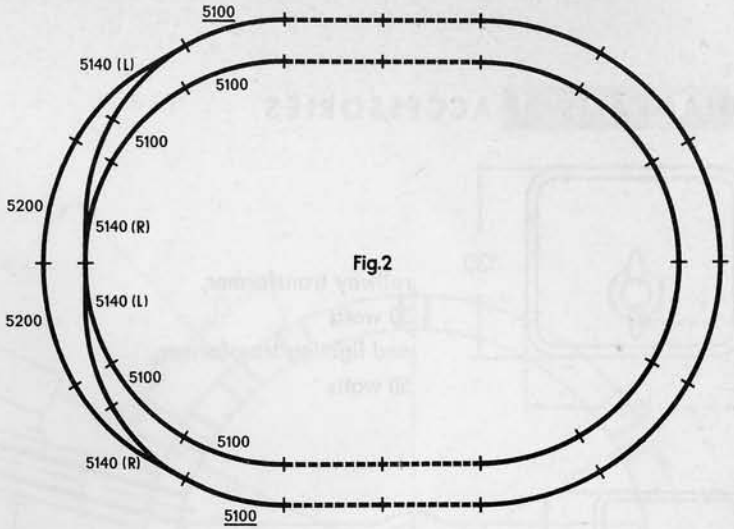


Fig. 2 **Crossing over from the outer to the inner track, and vice-versa**

The 3″ (77,4 mm) spacing between concentric curves is maintened without needing any track make-up sections. A **5100** track section is joined to the facing end of the curved points laid in the outer curves.

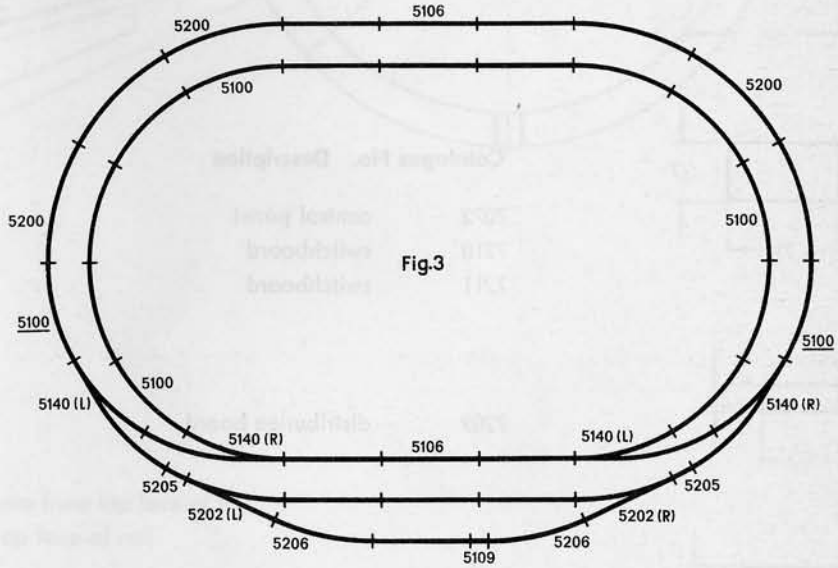

Fig. 3 **Curved points laid at the ends of a straight section**

In this case as well the 3″ (77,4 mm) spacing between concentric curves is maintained, and the diagram also shows how harmoniously curved points can be fitted into the layout of the track.

SOME EXPLANATORY NOTES ON THE TRACK LAYOUTS

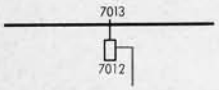
MÄRKLIN

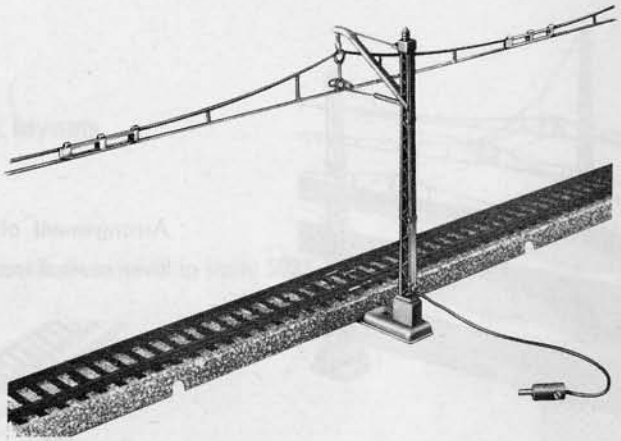
The track layouts shown in this booklet will be found to satisfy most desires and requirements because of the great care and attention to detail devoted to their preparation. If, however, one's own ideas are to be realised, it is also to be borne in mind that all alterations in the track layouts shown will result in the Lists of Parts for them also foregoing their claim to completeness.

The small systems are intended for branch line working, and so the trains to run over them must not have too great a length.

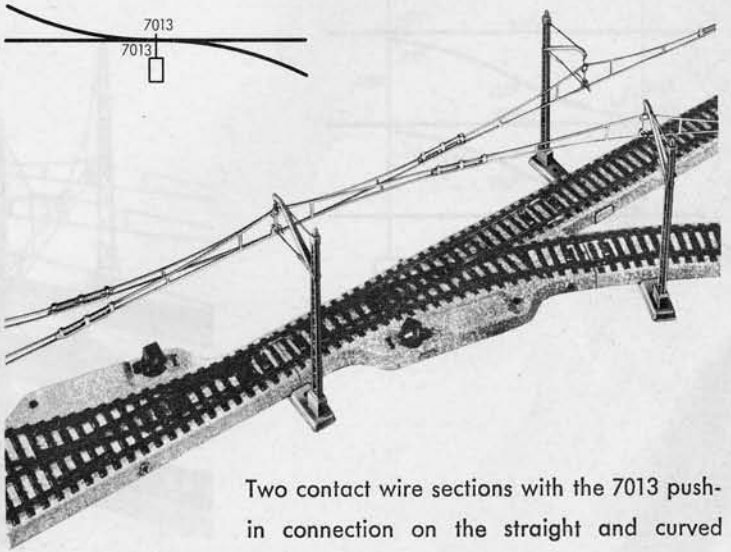
The signals and their isolated track sections can be altered as required, the lengths of isolated sections depending on the train speeds – for sidings, for example, an isolated section of one to two lengths of track will be sufficient.

The following examples are intended to make erection of the overhead contact wire system easier.



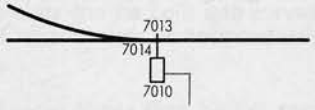


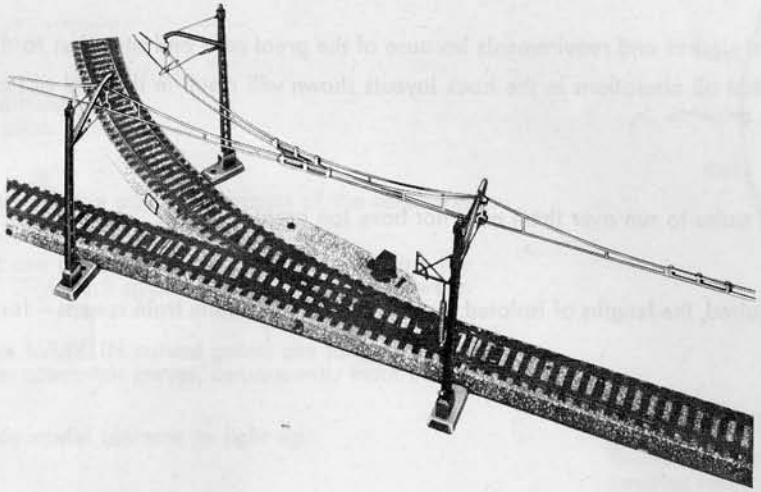
Contact wire section with the 7013 push-in connection and a feeder catenary support 7012 for signals.



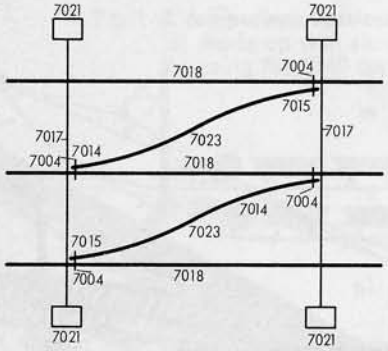
Two contact wire sections with the 7013 push-in connection on the straight and curved sections.

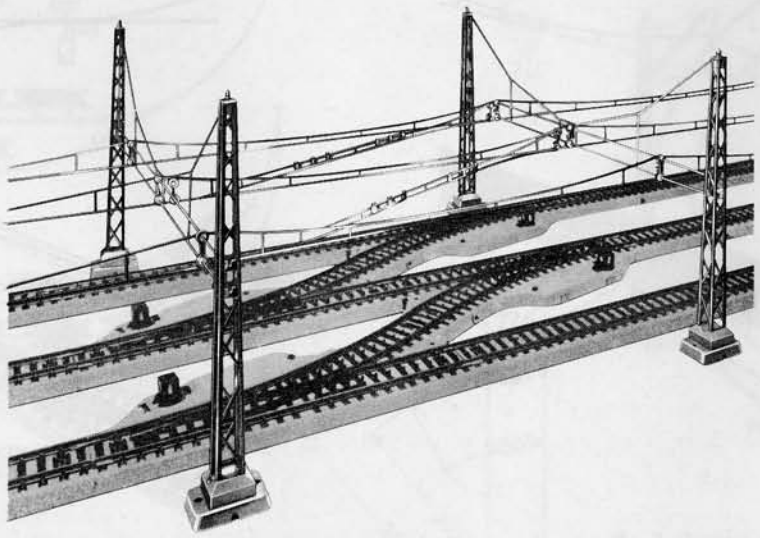
MÄRKLIN



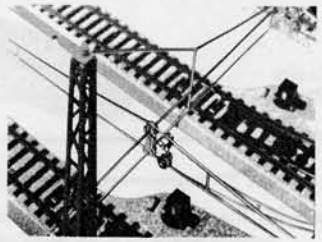


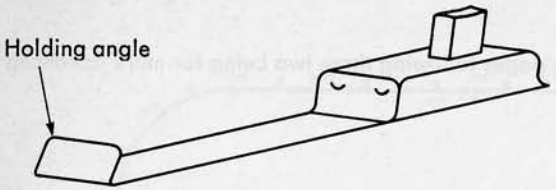
Contact wire section with the 7013 push-in connection and hollow contact wire section 7014 joining at a feeder catenary support. The figure arrangement gives the position of the contact wire sections; 7013 is on the outside and 7014 towards the catenary support.





Arrangement of the overhead contact wire system over several tracks, using the 7004 kit.





In many cases catenary supports with a cut-off holding angle or clip are required; that means that the angle or clip end of the fixing plate has to be cut off or straightened out.

Should the slip-in connections for the overhead contact wire sections not exactly register because of the spacing, and so make the stability of the contact wire doubtful, connection can be made by the 7004 fixing kit. The place for the screwed joint must be chosen so as to ensure a thorough hold for the join.

Photographs of railway layouts

The coloured illustrations of model railway system shown in this booklet are examples of the way a langscape setting can be built up for them. Our booklet "The MÄRKLIN HO Gauge Model Railway and its full-sized prototype" will be found very helpful in this connection.

Alterations to the layouts for utilising the space available to better advantage should be laid down beforehand in a draft plan of the system, using the MÄRKLIN templates for drawing it.

4 – 7014	

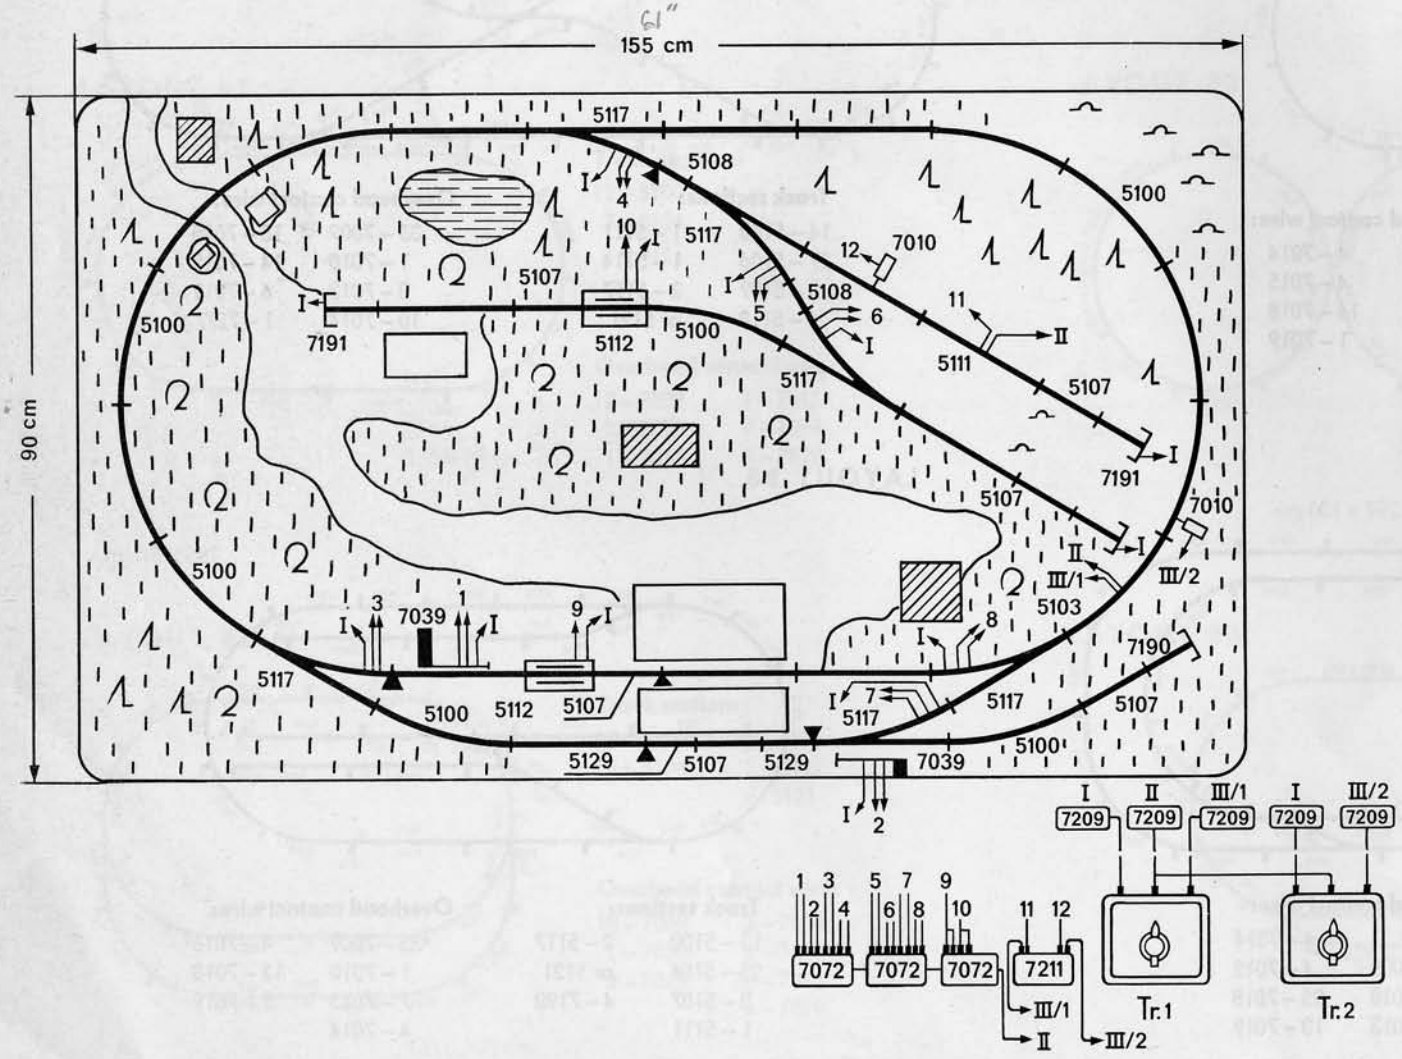
MÄRKLIN TRACK PLAN 1 for two trains

The plan provides a single-track oval line with a passing track and sidings. Sidings inside the oval can be cut in and out by a 7211 switchboard. The provision of an overhead contact wire system greatly enhances the possibilities of this set as a plaything.



Explanation of signs: (See page 11 also)

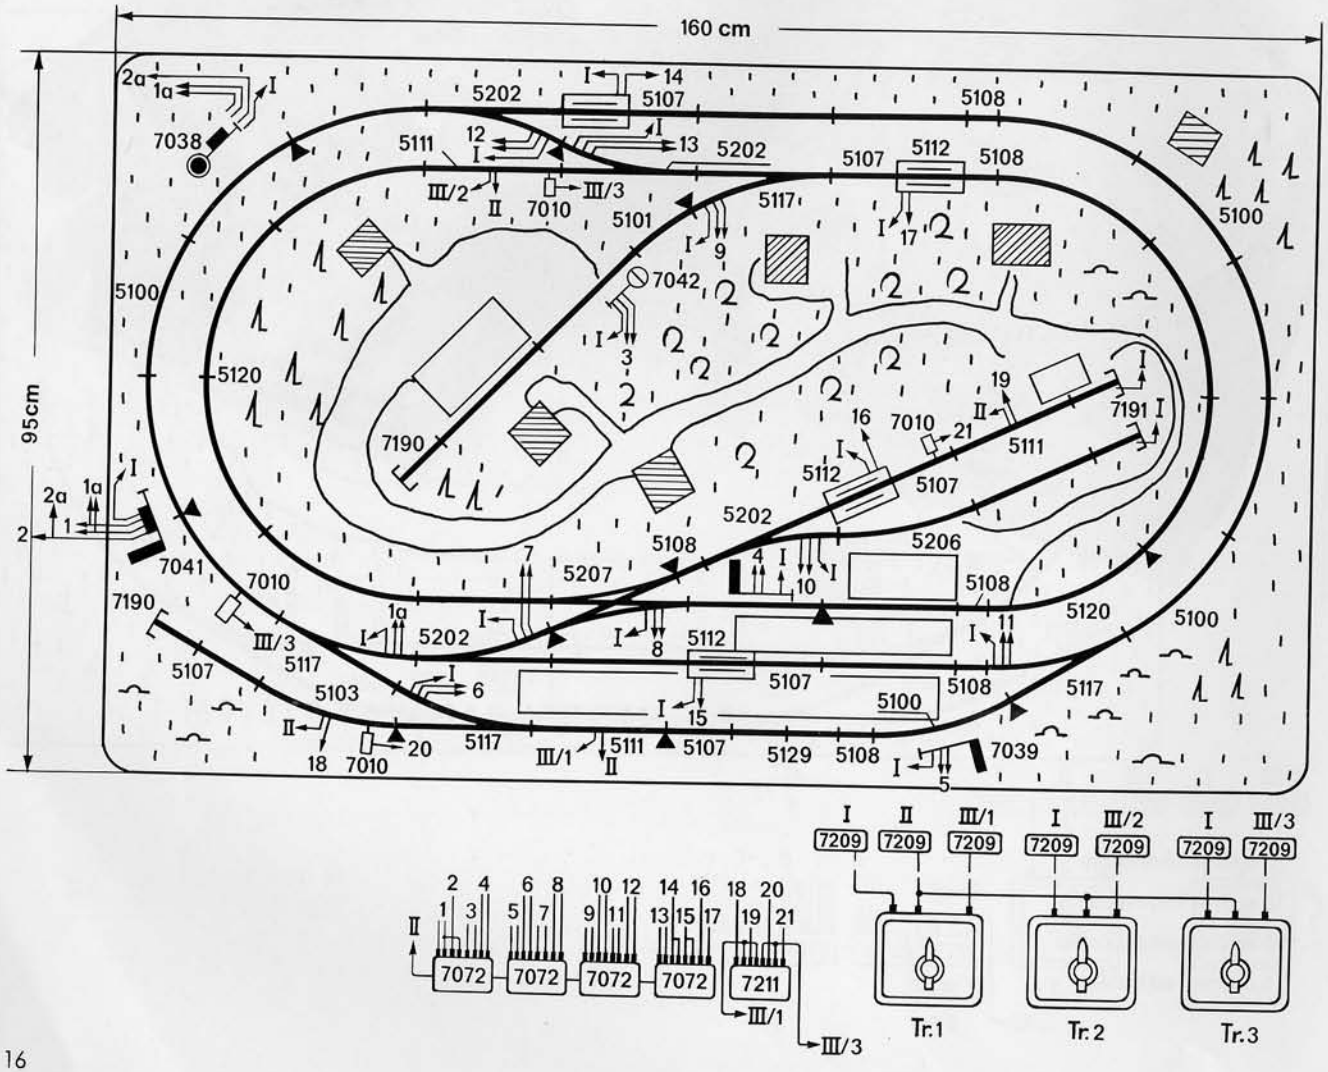
2 – 7010	2 – 7019	former	10 metres red cable
4 – 7013	1 – 7022		

MÄRKLIN TRACK PLAN 2 for two to three trains

This layout is divided into three current circuits – two for the stud surface contacts, separated between the inner and outer oval tracks, with the third circuit for the whole of the overhead contact wire system.

The inner oval track is made up with the 5120 curved track sections to save space. The upper industrial track is switched on and off by the track block signal 7042, the other three sidings being controlled by the 7211 switchboard. A thing to remember is that the surface contact system as well as the overhead contact wire system for these three sidings are connected to the 7211 switchboard. Distant signal 7038 and home signal 7041 are coupled to points 1a so that they tally with the points setting in the "off" position.



Track sections:

11 – 5100	6 – 5108	8 – 5120
1 – 5101	3 – 5111	2 – 5129

7010 III/3	Feeder catenary support 7010

This layout is intended to represent a branch or secondary line that has a long loop or passing track in addition to the single-track section that can be operated in both directions. The exit from the station is controlled by the two signals 6 and 7. So that the isolated section in front of these signals can also be used in the opposite direction, one 7045 universal remote-control switch is required for each, the switches being operated by the control track section 5146 or 5147.

The surface contact system and the overhead contact wire system each form a circuit, so that two railway transformers are required.

Track sections:

MÄRKLIN MODEL RAILWAY SYSTEM 3

MÄRKLIN TRACK PLAN 4 for one to two trains

Track plan No. 4 is for a single-track line with some sidings, the tracks inside the oval being safeguarded by signals. Traction current for the outside siding a can be switched on and off from switchboard 7211. With this circuit, shunting can be carried out on the inner tracks and a locomotive laid up on the outside siding with the current cut off.

MÄRKLIN

TRACK PLAN 5

for one to two trains

The special attraction of this layout is the small space it takes despite its double reversing loop. The 5211 crossing with its favourable crossing angle of 48 degrees 34 minutes makes this track system possible, and the integral signals allow very interesting traffic by two trains. The reversing loops divide the space into industrial and residential areas (see photograph).

Tr. 1 Tr. 2	Transformer for centre stud contact line and lighting Transformer for overhead contact wire and lighting		

MÄRKLIN TRACK PLAN 6 for two to three trains

The track layout consists of two oval lines, one inside the other, with double reversing loops, the perpendicular position of the double slip points 5128 being the decisive factor in this instance. The short sections of the reversing loops will only allow the smaller trains to stop on them.

Parts 7014, 7015 and 7022 of the overhead contact wire system are to be connected together by their eyes with the 7004 fixing screws at points Ⓐ and Ⓑ .

Track sections:

TRACK PLAN 7

MÄRKLIN TRACK PLAN 7 for two trains

The form of this track plan is set by the horizontal inclusion of the 5207 double slip points. A turntable with running sheds (engine sheds) can also be included. The turntable and the two sidings next to the slewing crane are not provided with overhead contact wires.

MODEL RAILWAY SYSTEM 8

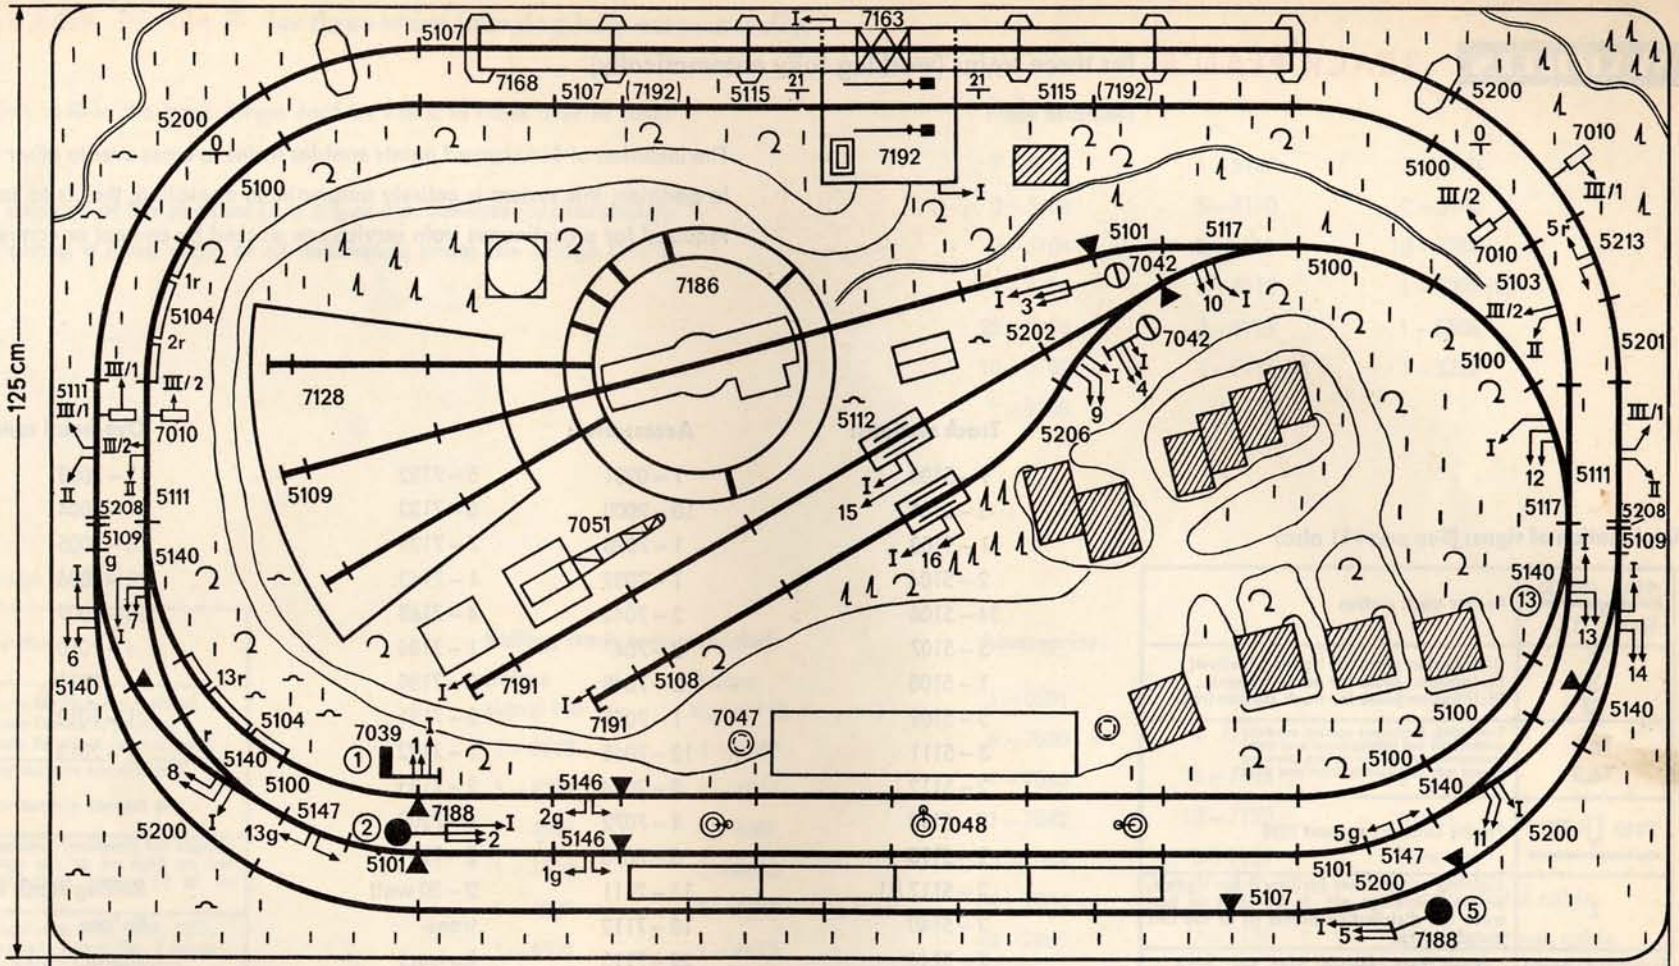
(working fully automatically)

MÄRKLIN

TRACK PLAN 8

(working fully automatically)

4x8



Fully-automatic working:
The three trains stand before the signals 1, 2 and 5 at danger. Set the transformers and signal No. 1 to "Off"; the trains will then start running completely automatically.

For playing with the set:
If the set is to be used for playing with, and not for fully automatic working, take the plugs out of the contact and control track sections. Signals and points will then be operated by the 7072 control panels already shown on the diagram.

MÄRKLIN TRACK PLAN 8 for three trains (working fully automatically)

The inclusion of 5140 curved points enables trains to cross over to other tracks outside the station. In addition, this system is entirely automatic in operation, that is to say, the signals and points required for a continuous train service are worked by contact or control track sections.

Explanation of signs: (See page 11 also)

MÄRKLIN TRACK PLAN 13 for three trains (with fully automatic working)

This set, with its double reversing loop, is particularly interesting as a landscaped layout while its numerous bridges enable its character as a river and harbour model to be readily recognised.

Fulli automatic working:

The trains stand before signals 2, 6 and 7 that are against them (i.e., at danger). Set the transformer and signal No. 2 to "off", the trains will then start running completely automatically.

For playing with the set:

If the set is to be changed over from fully automatic working so that it can be played with, the plugs must be taken out of the contact and control track sections. Points and signals will then be operated only by the 7072 control panels already shown in the diagram.

Track sections:

MÄRKLIN TRACK PLAN 14 for two trains (fully automatic working)

This comparatively small double oval line has long tracks through the station through using the 5140 curved points, as crossing over to another track then takes place outside the station.

Fully automatic working:

The trains stand before signals 1 and 3 against them. Set the transformer, and signal No. 1 to "off", and the trains will then start to run entirely automatically.

Using the set for playing with:

If the set is to be changed over for playing, the plugs must be taken out of the contact and control track sections. Signals and points will then be operated only by the 7072 control panels already shown on the diagram.

Track sections:

9 – 5100	1 – 5205
1 – 5101	1 – 5206
2 – 5103	1 – 5207
2 – 5104	1 – 5213

1 – 4003

MÄRKLIN TRACK PLAN 15 for four trains (fully automatic working)

This set can be divided in the middle for easier transport. If the centre and outer tongues of the track sections be removed at the join, the two halves of the set can easily be placed together horizontally. The missing electrical connection for the tracks must be remade by soldered cables with plugs and sockets beneath the table. The use of multiple plugs and sockets is advisable, so as not to connect the numerous cables etc. wrongly.

Fully-automatic working:

The trains are before signals 1, 2, 3 and 6 against them; set the transformer and signals Nos. 2 and 3 to "off", and the trains will then start running automatically.

Playing with the set:

To change the set over for playing with it, take out the plugs from the contact and control track sections; signals and points will then be operated only by the 7072 control panels already included in the diagram.

Track sections:

32 – 5100	12 – 5108	8 – 5129
5 – 5101	8 – 5109	1 – 5146

TRACK PLAN 17

MÄRKLIN TRACK PLAN 17 for three trains

The high level of the line – 5 in. – (123 millimetres) calls for a long rise that has therefore been laid at the back along the whole set. The front part of the layout has a constant height of 5 in. (123 millimetres) while the centre part has a "nil" height.
The double reversing loops give long stretches of track for running over.

Explanation of signs: (See page 11 also)

TRACK PLAN 18

MÄRKLIN MODEL RAILWAY SYSTEM 18

MÄRKLIN TRACK PLAN 19 for three trains (with fully automatic working)

This set has interesting layouts with the 5140 curved points to the left and right of the station premises. A noteworthy point is that a 5100 track section is placed in between each of the curved points.

Fully automatic working:

The trains stand before signals 2, 3 and 4 that are against them. Set the transformer and signal No. 4 to "off". The trains will then start to run completely automatically.

For playing with the set:

If the set is to be changed over for playing with, the plugs must be taken out of the contact and control track sections. The signals and points will then be operated only by the 7072 control panels already included in the diagram.

Track sections:

14 – 5100	7 – 5109	2 – 5129
4 – 5101	1 – 5110	3 – 5140
3 – 5102	2 – 5111	4 – 5146

MÄRKLIN TRACK PLAN 20 for four trains (with fully automatic working)

This set contains two reversing loops, one on the plateau and the other running partly through the mountain. This, again, shows how interesting the layout of the line can be by using reversing loops.

Fully automatic working:
The trains stand before signals 1, 4, 5 and 6, all against them; set the transformer and signals 1 and 6 to "off". The trains will then start to run entirely automatically. The trains before signals 1 and 4 and before signals 5 and 6 mutually control one another.

For playing with the set:
If the set is to be changed over for playing with it, the plugs must be taken out of the contact and control track sections. The signals and points will then be operated only by the 7072 control panels already shown in the diagram.

Curved track sections

For drafting or drawing up plans for a railway layout, knowing the diameters of circles that can be worked with is important (see fig. 1). The standard 5100 circle has a diameter of 28⅓" (720 millimetres) measured from centre to centre of the track, and its accompanying large concentric circle 5200 has a diameter of 34½" (874,8 millimetres), measured similarly from centre to centre of the track. The spacing between it and the standard circle is 3" (77.4 millimetres), measured between track centres. Both circles are made up of twelve track sections, each covering an angle of 30 degrees.

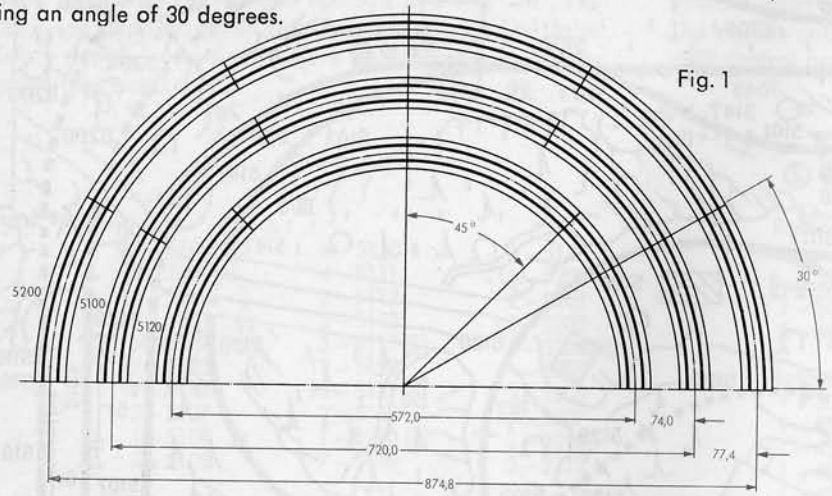

Fig. 1

The small concentric circle is made up of the 5120 track sections and has a diameter of 22½" (572 millimetres). A full circle requires eight of these 5120 sections, each one representing an angle of 45 degrees. The spacing between it and the standard circle is 2⁹/₁₀" (74 millimetres) measured between track centres.

One 5200 circle – 12 track sections – approximately 35⁹/₁₀" (91,2 centimetres) outside diameter
One 5100 circle – 12 track sections – approximately 30" (76,0 centimetres) outside diameter
One 5120 circle – 8 track sections – approximately 24" (61,0 centimetres) outside diameter

The design of the track plan for a railway system may make joining track sections of different radii together necessary, and there is no difficulty in doing so. There will not be any kinks where different track sections join up, as one radius merges into the other perfectly.

Junctions with single 5117 points on a straight track

If provision has not been made to keep to the 3" concentric spacing between track centres, the 5117 single points are best used, with a points angle of 30 degrees. The concentric layout (track centre spacing 3⁴/₅", or 96.4 millimetres) can be restored by using a full length (1/1) curved 5100 track section, or a second 5117 points (see page 71, fig. 1).

Track connections with single 5202 points with the 3" concentric spacing (77.4 millimetres)

On a straight stretch the 5202 points provide a track connection in the 3" concentric spacing. The special feature of the 5202 points is that their branch line has an included angle of 24 degrees 17 minutes instead of the 30 degrees of the 5117 points, so that the track centre spacing is less (3" instead of 3⁴/₅") because of the smaller angle; to get the branch track parallel to the straight track of the points (the original track) a 5206 track section must be used, as it also has an included angle of 24 degrees 17 minutes (see fig. 2).

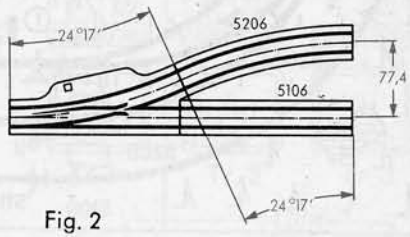

Fig. 2

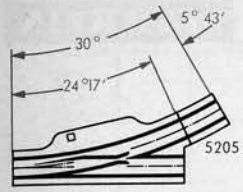

Fig. 3

The branch track of the points can be increased to an angle of 30 degrees by the 5205 section (see fig. 3), but then there will no longer be the 3" concentric spacing, and it will be increased to 4³/₁₀" (117,4 millimetres).

Now, to make a third parallel connection with the 3" track spacing the 5207 double-slip points will be required (see fig. 4).

The diagonals of the 5207 double-slip points must be extended either side by the 5208 ⅓" (8 millimetres) track section, so as to restore the 3" parallel spacing, and the track layout can then be lengthened further by the 5106 track sections, so that each line of rails is then the same distance apart.

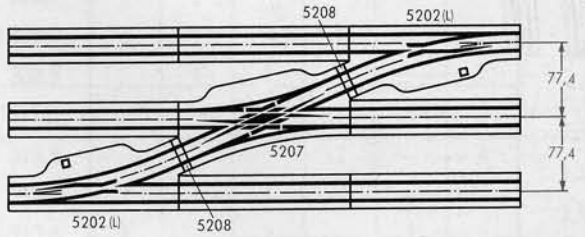

Fig. 4

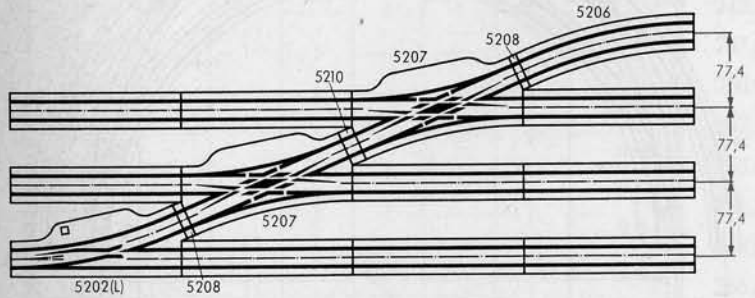

Fig. 5

Track planning may result in two double-slip points 5207 having to be connected diagonally, but as two 5208 track sections cannot be joined together, section 5210, which is double the length, has been provided, this section, ²/₃" long, is placed between the two double-slip points 5207, and the 3" parallel spacing is again restored. (See fig. 5)

Track connections or cross-overs with the 5140 curved points in the 3" parallel spacing

The 5140 curved points provide a track connection or cross-over from the standard 5100 circle to the large concentric 5200 circle in the concentric 3" spacing

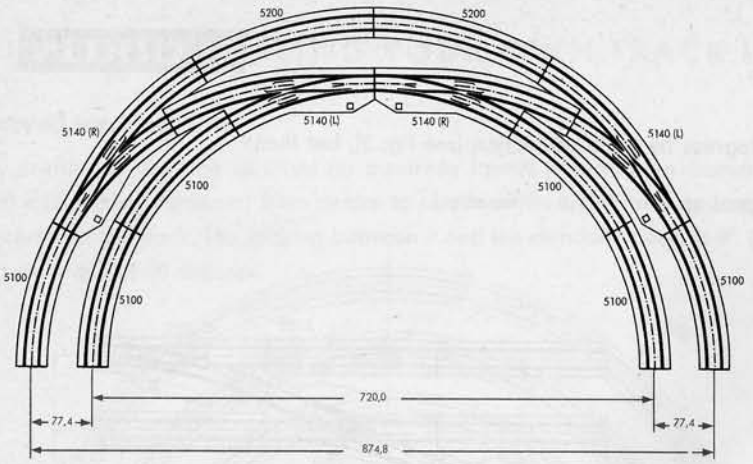

Fig. 6

As figs. 6 and 7 show, the curved points enable cross-overs to be provided between the two circles, from the outer to the inner one, or vice-versa.

A point to notice specially here is that a **5100** track section is needed at the peak of the points in the large concentric circle 5200. In this large circle, therefore, two 5200 track sections take the place of one curved points and one **5100** section.

The 5140 curved points cannot be used for a connection or cross-over from the standard 5100 circle to the small 5120 concentric circle.

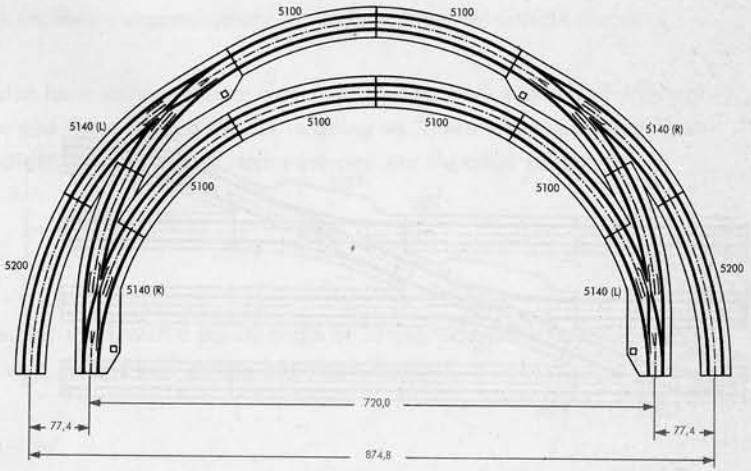

Fig. 7

Combinations with straight track sections

The following Table is to show MÄRKLIN enthusiasts the full extent of possibilities for equalising track lengths by the straight track sections 5106 (full length, 1/1), 5107 (half-length, 1/2), 5108 (quarter-length, 1/4), 5109 (three-sixteenths length, 3/16), 5110 (one-eighth length, 1/8) and 5129 (2¾").

The left-hand column in this Table shows the length X found in the actual layout or else on the layout plan, to be made up by track sections. Reading across from this X figure gives the number and type of track sections to be used. The column on the extreme right gives the difference between the individual X lengths.

Length X in mm	Track sections 5106 1/1	5107 1/2	5108 1/4	5109 3/16	5110 1/8	5129	Difference in mm

VARIOUS TRACK SPACINGS WITH ONE AND TWO POINTS

MÄRKLIN

Single points and curved points

The track diagrams 1 to 65 give a general idea of the numerous combinations to be obtained for a single branch with one or two points or switches. The distance or spacing from centre to centre of a track section and the free space between the sections are given in every case, bearing the the track width of, roughly, 1½" (37,5 millimetres) in mind (see page 2). The two tracks are brought out to the same length, so that they can be continued with the same number of straight sections with parallel spacing.

The figures from 1 to 42 can be made up with right-hand as well as with left-hand points.

In figures 1 to 28 MÄRKLIN 5117 or 5121 points are used, having an included angle of 30 degrees.

Figures 29 to 42 show the same combinations, but with MÄRKLIN 5202 points that have an included angle of 24 degrees 17 minutes. These MÄRKLIN 5202 points can have the 24 degrees 17 minutes included angle increased to 30 degrees by using track section 5205.

Various track spacings can be made up by using a pair of points, figures 43 to 51 showing this arrangement for MÄRKLIN 5117 and 5121 points. Figures 52 to 55 show the same. using the 5202 points.

Branches with curved points 5140 (figs. 56 to 58).

The track centre spacing is reduced by laying curved points in the quadrant (one-quarter) of a circle (3", 2³/₁₀", 2³/₂₀"). Any smaller track spacing is not advisable, as in such case two trains could no longer pass one another without danger.

Figures 59 to 65 show possibilities for laying a pair of 5140 curved points, fig. 59 being the normal one.

Figs. 60 and 61: In these cases the curved points are moved down by a half or whole track section (½ or 1/1) so as to gain space for laying a 5147 control track section or a 5104 contact section.

Figs. 62 and 63. A half or whole (½ or 1/1) track section is laid between the curved points, so that here also one 5147 control track section or one 5104 contact section can be laid.

The outer circle is made up with 5100 track sections so as to keep the track spacing as small as possible.

Figs. 64 and 65 likewise show how sections 5101 and 5100 respectively can be laid between the curved points, but the outer circle is now made up of the 5200 sections, so that the track spacing is larger. This greater track spacing is, for instance, desirable if the outer circle is on an upgrade or one line is taken into a tunnel entrance.

TRACK LAYOUT COMBINATIONS

MÄRKLIN

(see page 86 for those with the 5140 curved points)

The track layouts in figs. 66 to 117 have been laid with the single 5117 or 5202 points and 5114 or 5128 crossings, and are intended to give the railwayman an incentive to make up his own system to satisfy his own desires and conditions available, from the large number of possibilities.

We can now use the foregoing basic figures to develop gridiron sidings, and in doing so we can gain an idea of the number of points and track sections required. Fig. 66 may be examined as an example – it is made up of fig. 1 (blue) and fig. 43 (green), and the bottom line of rails will then have to be built up with the same number of track sections 5106 and 5108 as above (green).

Fig. 1
Curved track section replaced by points

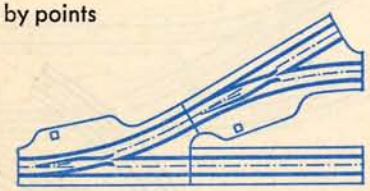

Fig. 43

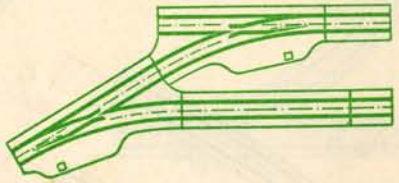

Fig. 66

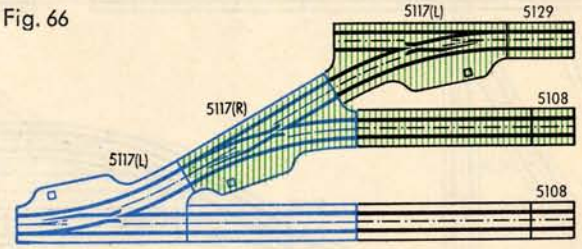


With a closed gridiron the appropriate points and tracks are needed on the opposite side, and that means that the two 5108 quarter-length (1/4) track sections can be replaced by one 5107 half-length section (1/2), and the gridiron can then be lengthened as desired by laying straight track sections in between.

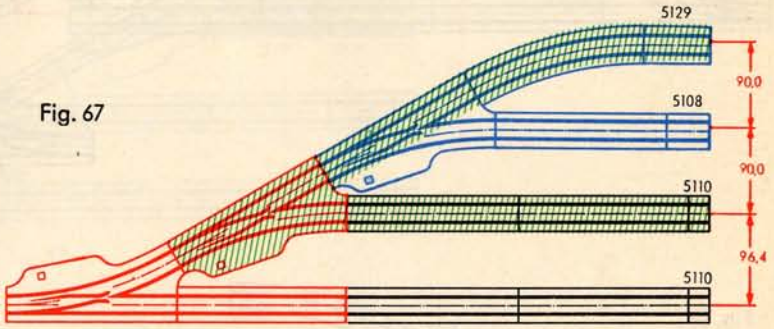
Fig. 67 is another example, consisting of three individual figures, the coloured lines rendering these figures readily recognisable.

The figures up to 72 show similar examples.

The reversing triangle shown in fig. 75 is made up of MÄRKLIN points and track sections of the smallest dimensions possible.

Fig. 79 shows a double cross-over using the 5114 crossing and four right-hand points 5117 (R) or 5121 (R); this figure can be built similarly with left-hand points. The following fig. 80 shows the same layout but with only one 5128 doubleslip points, though this has the disadvantage that on a two-track line trains can meet on the crossing unless they are safeguarded by signals. In contrast, the double cross-over using points 5128 and and 5117 (L) shown in fig. 82 ensures trouble-free operation.

Fig. 67



Figs. 84 and 85 show points connections usually to be found in stations and goods yards; in these track layouts points 5117 and the double-slip points 5128 are used.

All following track layouts are made up in a similar way to that described in the foregoing examples, points 5202 and double slip points 5207 being chiefly used in these cases.

Track layouts 105, 108 109 and 110 include the small 5211 crossing, the special advantage being the short length and the angle allowing direct connection to the 5202 points.

MÄRKLIN

Figs. 115, 116 and 117 show track combinations with the 5140 curved points. The three tracks coming from the right are continued in one track in fig. 115, in two tracks in fig. 116 and in three tracks in fig. 117.
